

GENERAL

The Caproco standard high pressure access fitting provides access to systems under full operating conditions (up to 6,000 psi / 41.4 Mpa), eliminating any need for system shut-down in order to obtain vital corrosion data. Certain models are rated up to 10,000 psi / 68.9 Mpa.

This versatile fitting comes in different mounting configurations, allowing operators the flexibility to select the optimum location based on the type of monitoring desired and any location-specific characteristics (such as height clearance) that need to be taken into consideration.

APPLICATION

Once the fitting is attached to the line, it acts as the conduit through which hot tapping and swabbing can take place. After the line is successfully "tapped in", monitoring equipment can be exposed to the process stream by using the Caproco Retriever and Service Valve to install either a Solid or Hollow plug, to which monitoring equipment can be attached. Once installed, the plug seals off the fitting, thereby maintaining line integrity.

The Caproco access fitting is available in seven main body shapes:

- Flareweld
- Buttweld
- Socketweld
- NPT Threaded
- Flanged
- "L" Trap (Single)
- Cross Trap (Double)

Fittings can be located anywhere on-line that local operating conditions permit. Trap fittings are typically mounted underneath the line and gather samples of the liquids and residues that exist along the line bottom. Monitoring through traps simulates the corrosive conditions of stagnant locations that may exist in the line.

SPECIFICATIONS

The Buttweld, Socketweld, Flareweld and NPT Access fitting bodies are manufactured from 1020 hot rolled bar stock or from A350LF2/A105N forged bar. Flange fittings are manufactured from long weldneck forgings. Alternative materials and sizes are available upon request.

All welds are stress relieved and inspected according to prevailing relevant codes.
